

Advance Encryption Standard

Topics

- ▶ **Origin of AES**
- ▶ Basic AES
- ▶ Inside Algorithm
- ▶ Final Notes

Origins

- ▶ A replacement for DES was needed
 - ▶ Key size is too small
- ▶ Can use Triple-DES – but slow, small block
- ▶ U.S. NIST issued call for ciphers in 1997

▶ 15 candidates accepted in Jun 98

▶ 5 were shortlisted in Aug 99

AES Competition Requirements

- ▶ Private key symmetric block cipher
- ▶ 128-bit data, 128/192/256-bit keys
- ▶ Stronger & faster than Triple-DES
- ▶ Provide full specification & design details
- ▶ Both C & Java implementations

AES Evaluation Criteria

2128

▶ initial criteria:

- ▶ security – effort for practical cryptanalysis
- ▶ cost – in terms of computational efficiency
- ▶ algorithm & implementation characteristics

▶ final criteria

- ▶ general security
- ▶ ease of software & hardware implementation
- ▶ implementation attacks
- ▶ flexibility (in en/decrypt, keying, other factors)

AES Shortlist

5 finalists

▶ After testing and evaluation, shortlist in Aug-99

▶ MARS (IBM) - complex, fast, high security margin

▶ RC6 (USA) - v. simple, v. fast, low security margin

▶ Rijndael (Belgium) - clean, fast, good security margin

▶ Serpent (Euro) - slow, clean, v. high security margin

▶ Twofish (USA) - complex, v. fast, high security margin

▶ Found contrast between algorithms with

▶ few complex rounds versus many simple rounds

▶ Refined versions of existing ciphers versus new proposals

Rijndae: pronounce "Rain-Dahl"

The AES Cipher - Rijndael

- ▶ Rijndael was selected as the AES in **Oct-2000**
 - ▶ Designed by Vincent Rijmen and Joan Daemen in Belgium
 - ▶ Issued as **FIPS PUB 197** standard in Nov-2001

V. Rijmen

- ▶ An **iterative** rather than **Feistel** cipher
 - ▶ processes data as block of 4 columns of 4 bytes (128 bits)
 - ▶ operates on entire data block in every round

$$16 \times 8 = 128$$

- ▶ Rijndael design:
 - ▶ simplicity
 - ▶ has 128/192/256 bit keys, 128 bits data
 - ▶ resistant against known attacks
 - ▶ speed and code compactness on many CPUs

J. Daemen

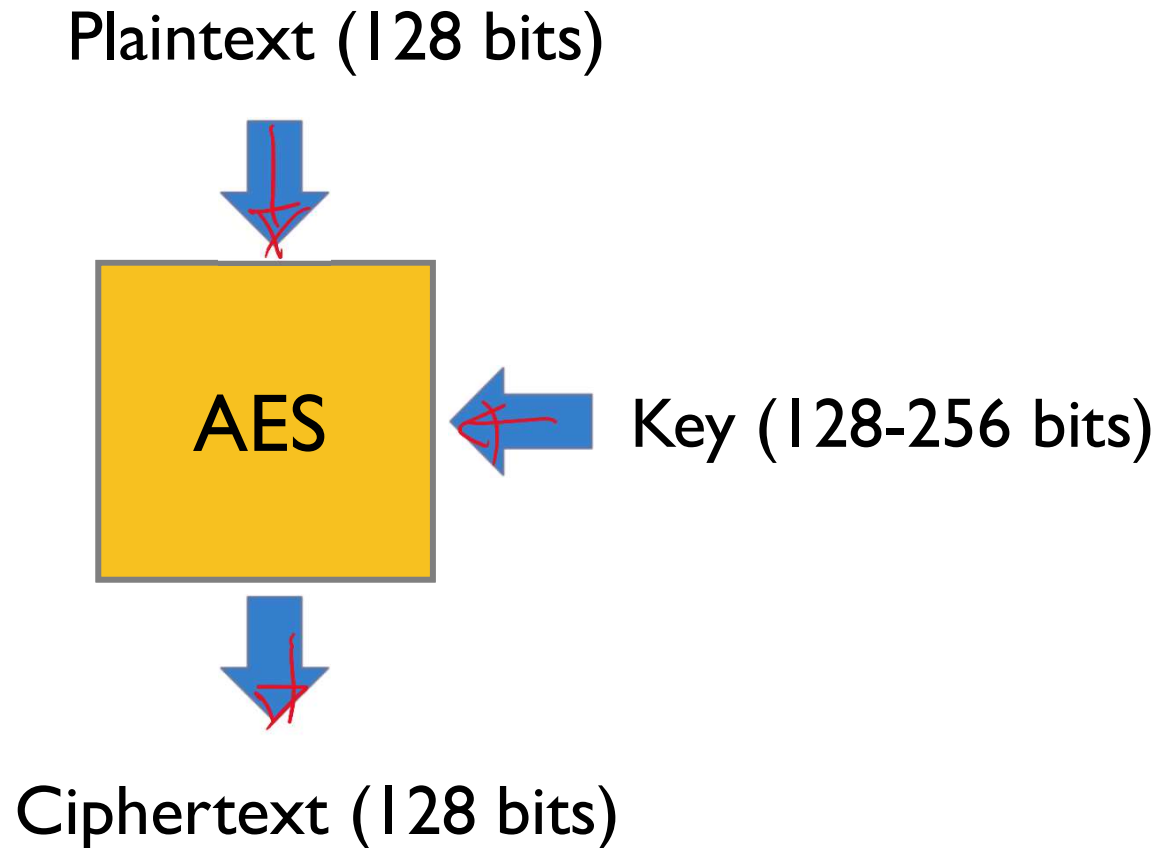

Topics

- ▶ Origin of AES
- ▶ **Basic AES**

High Level Description

Sen. subkeys

Key Expansion

- Round keys are derived from the cipher key using Rijndael's key schedule

Initial Round

- AddRoundKey : Each byte of the state is combined with the round key using bitwise xor

Rounds

- SubBytes : non-linear substitution step
- ShiftRows : transposition step
- MixColumns : mixing operation of each column.
- AddRoundKey

Final Round

- SubBytes
- ShiftRows
- AddRoundKey

No MixColumns

round 10

for 128-bit key

SubBytes: Nonlinear Byte Substitution

- ▶ A simple substitution of each byte
 - ▶ provides confusion

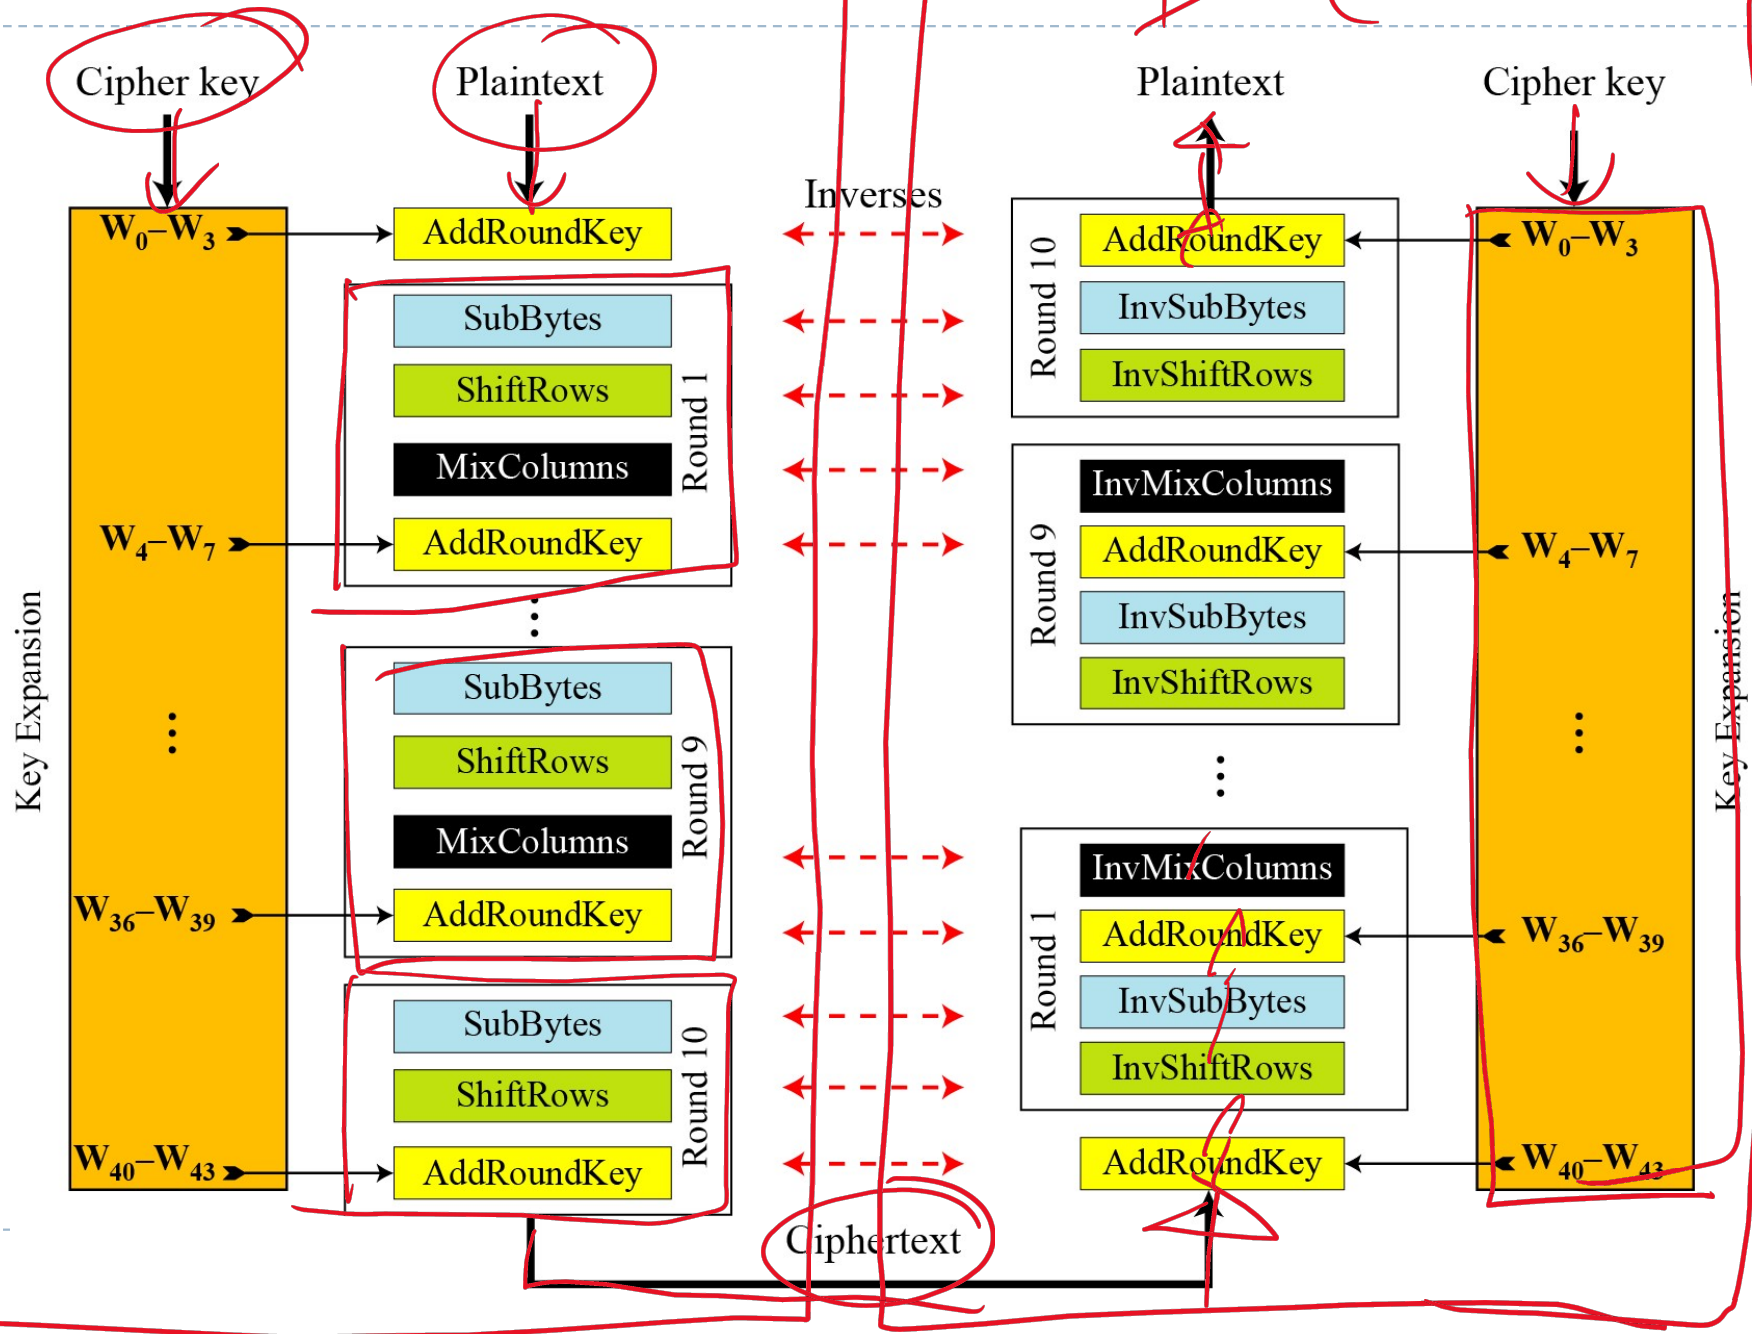

Same every time

- ▶ Uses one S-box of 16x16 bytes containing a permutation of all 256 8-bit values

Figure 7. S-box: substitution values for the byte xy (in hexadecimal format).

Overall Structure

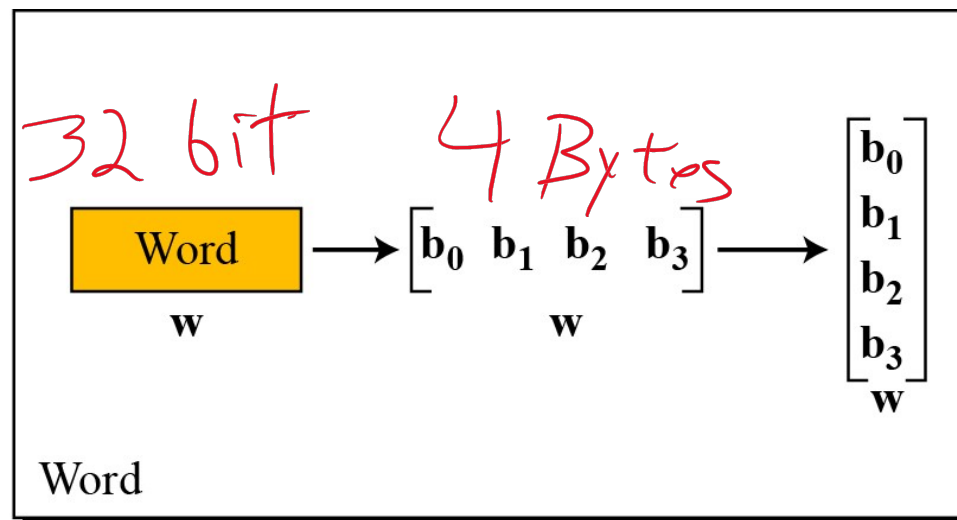

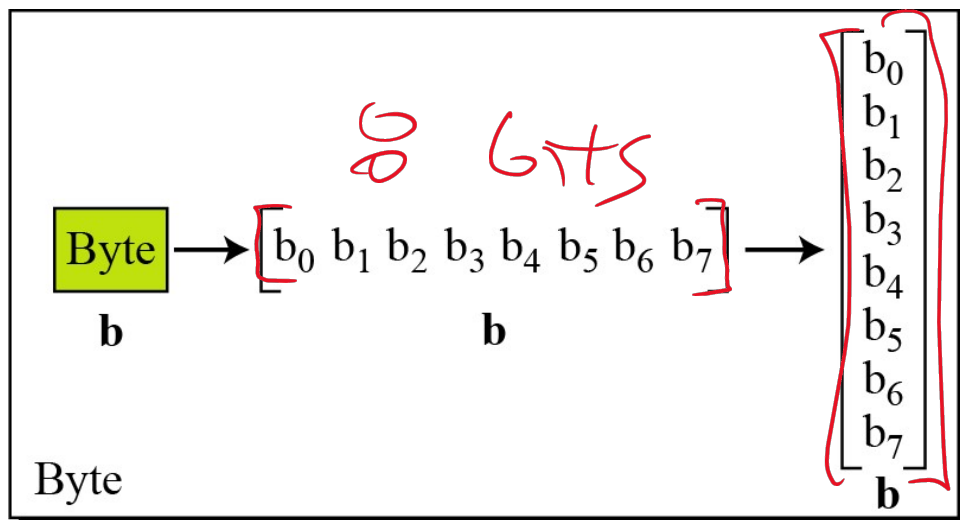

128-bit values

- ▶ Data block viewed as 4-by-4 table of bytes
- ▶ Represented as 4 by 4 matrix of 8-bit bytes.
- ▶ Key is expanded to array of 32 bits words

$$4 \times 32 = 128$$

Data Unit

$i = 0 \Rightarrow s_{0,0}$

Details of Each Round

Notes:

1. One AddRoundKey is applied before the first round.
2. The third transformation is missing in the last round.

SubBytes: Byte Substitution

$$ax^2 + bx + c = 0$$

- ▶ A simple substitution of each byte
 - ▶ provides confusion
- ▶ Uses one S-box of 16x16 bytes containing a permutation of all 256 8-bit values
- ▶ Each byte of state is replaced by byte indexed by row (left 4-bits) & column (right 4-bits)
 - ▶ e.g. ,byte {95} is replaced by byte in row 9 column 5
 - ▶ which has value {2A}
- ▶ S-box constructed using defined transformation of values in Galois Field-GF(2⁸)

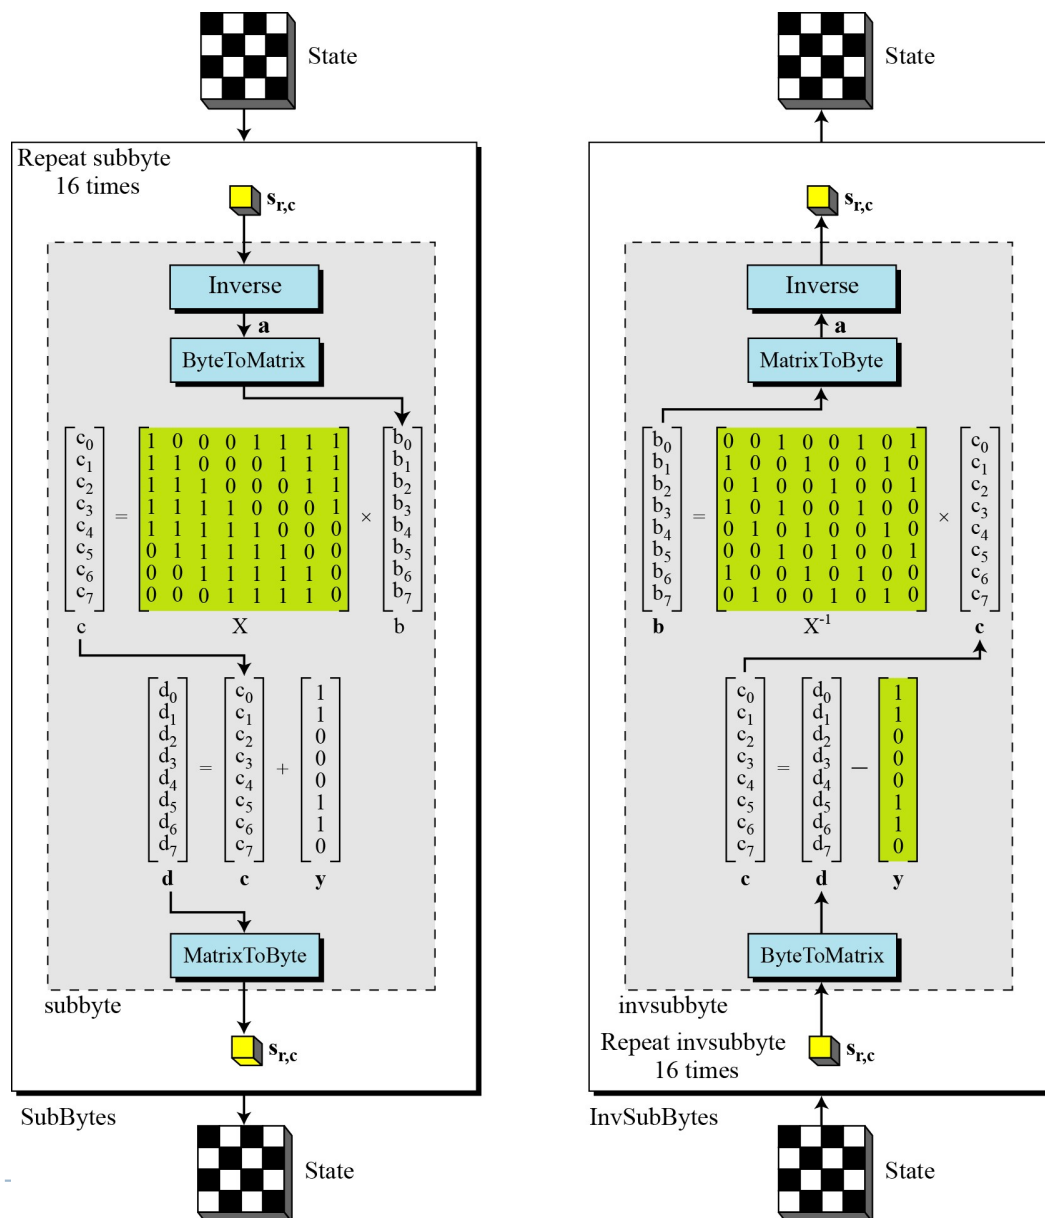

$$ax^5 + bx^4 + cx^3 + \dots = 0$$

affine \mathbb{F}

$$ax + b$$

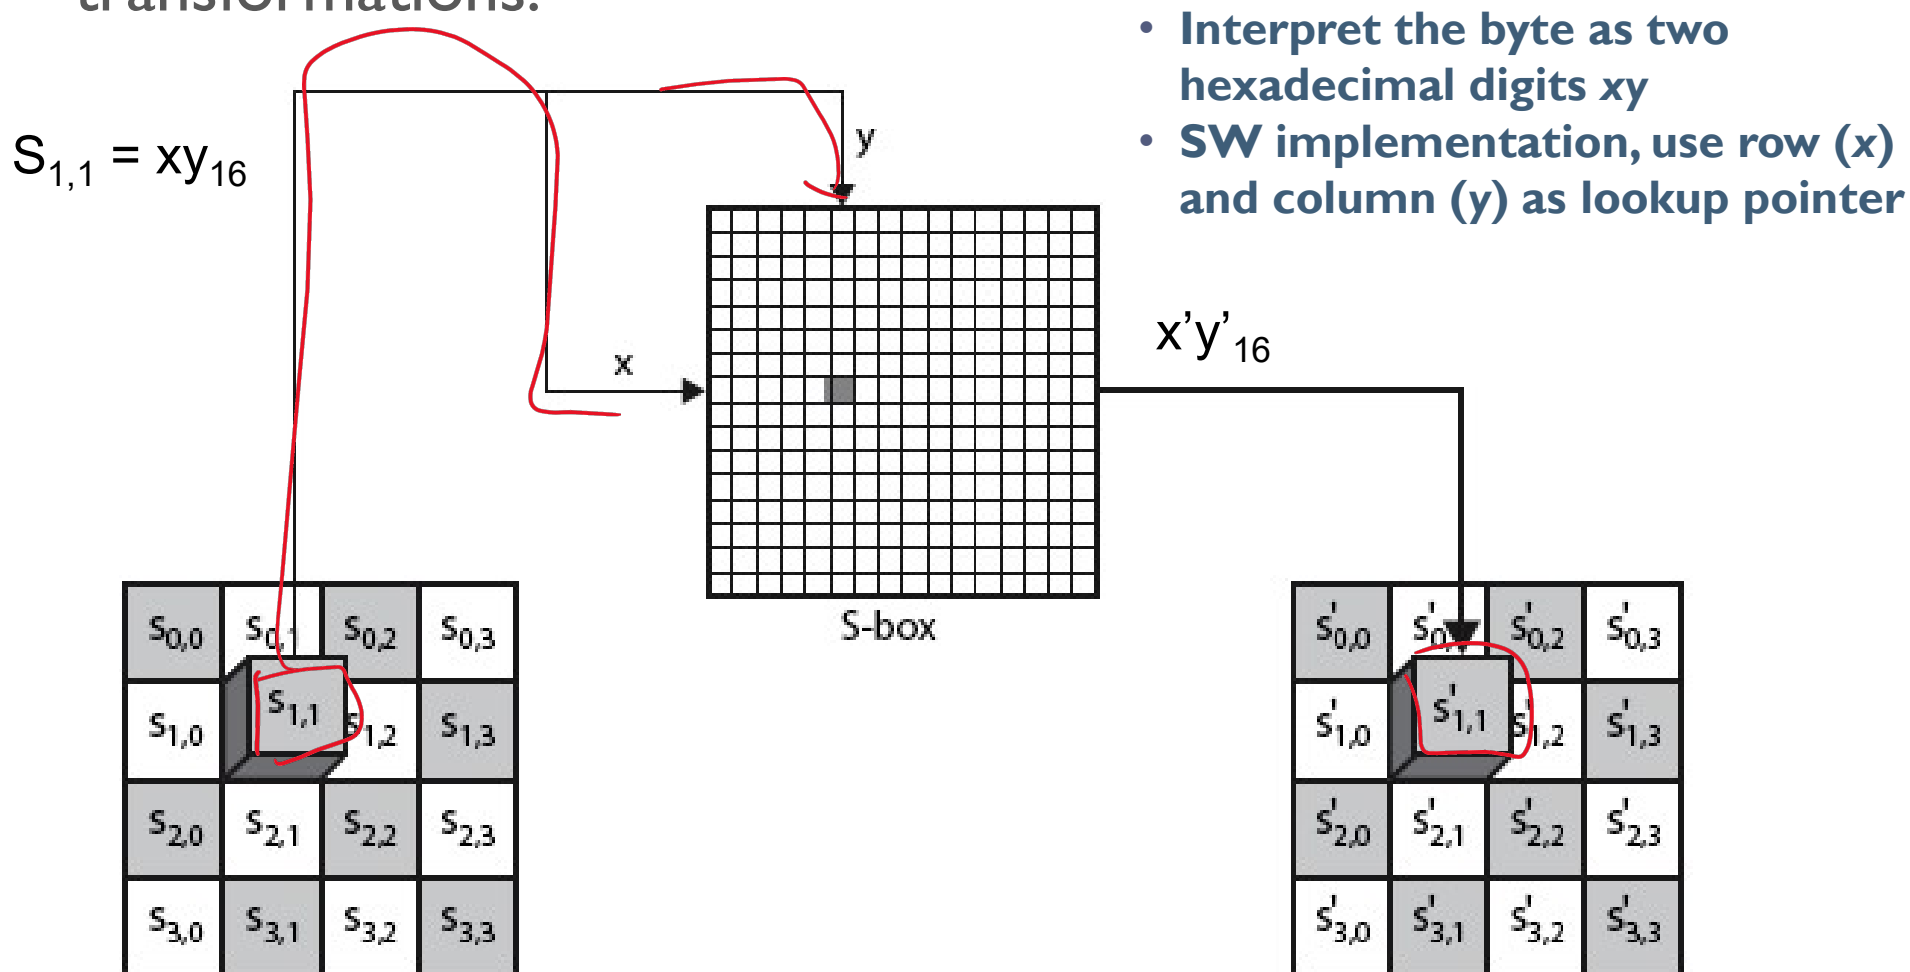

Galois : pronounce "Gal-Wa"

SubBytes and InvSubBytes

SubBytes Operation

- ▶ The SubBytes operation involves 16 independent byte-to-byte transformations.

SubBytes Table

- ▶ Implement by Table Lookup

Sample SubByte Transformation

- ▶ The SubBytes and InvSubBytes transformations are inverses of each other.

ShiftRows

always same

- ▶ Shifting, which permutes the bytes.
- ▶ A circular byte shift in each each
 - ▶ 1st row is unchanged
 - ▶ 2nd row does 1 byte circular shift to left
 - ▶ 3rd row does 2 byte circular shift to left
 - ▶ 4th row does 3 byte circular shift to left
- ▶ In the encryption, the transformation is called ShiftRows
- ▶ In the decryption, the transformation is called InvShiftRows and the shifting is to the right

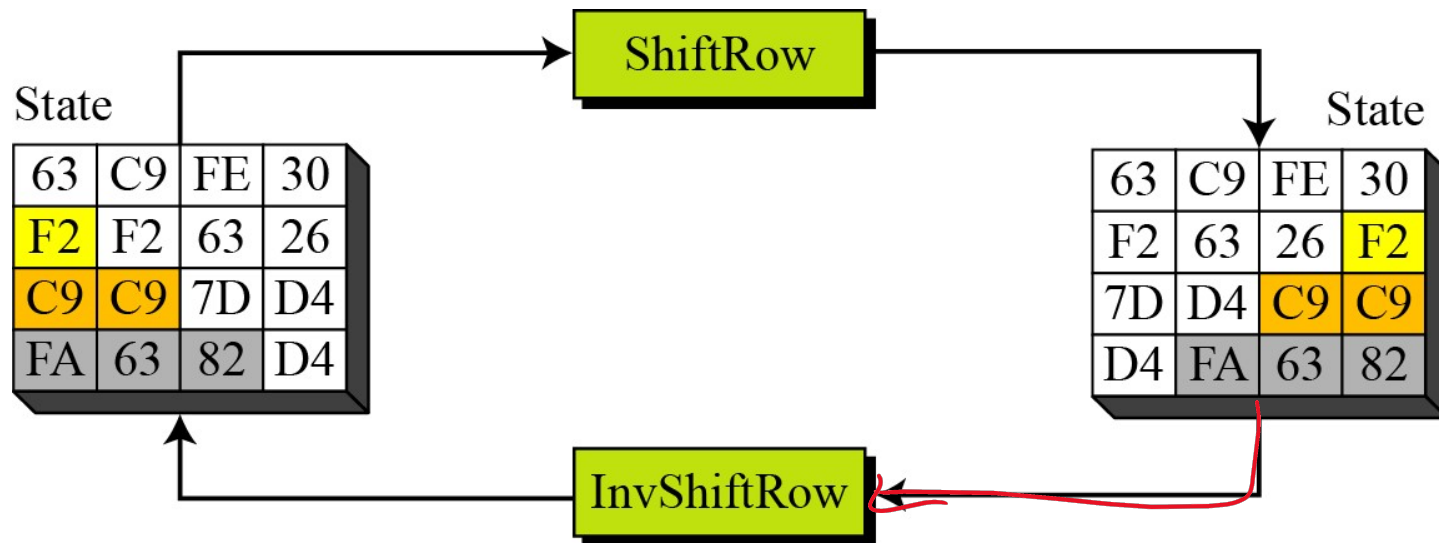

ShiftRows Scheme

fast coding

ShiftRows and InvShiftRows

MixColumns

mod 5

mod 7

Same each round

- ▶ ShiftRows and MixColumns provide diffusion to the cipher
- ▶ Each column is processed separately
- ▶ Each byte is replaced by a value dependent on all 4 bytes in the column
- ▶ Effectively a matrix multiplication in GF(2⁸) using prime poly $m(x) = x^8 + x^4 + x^3 + x + 1$

AES Round

"byte-view"

16 bytes

all in parallel

XOR

Original Key = 4 words \rightarrow 64 keys

AES Key Scheduling

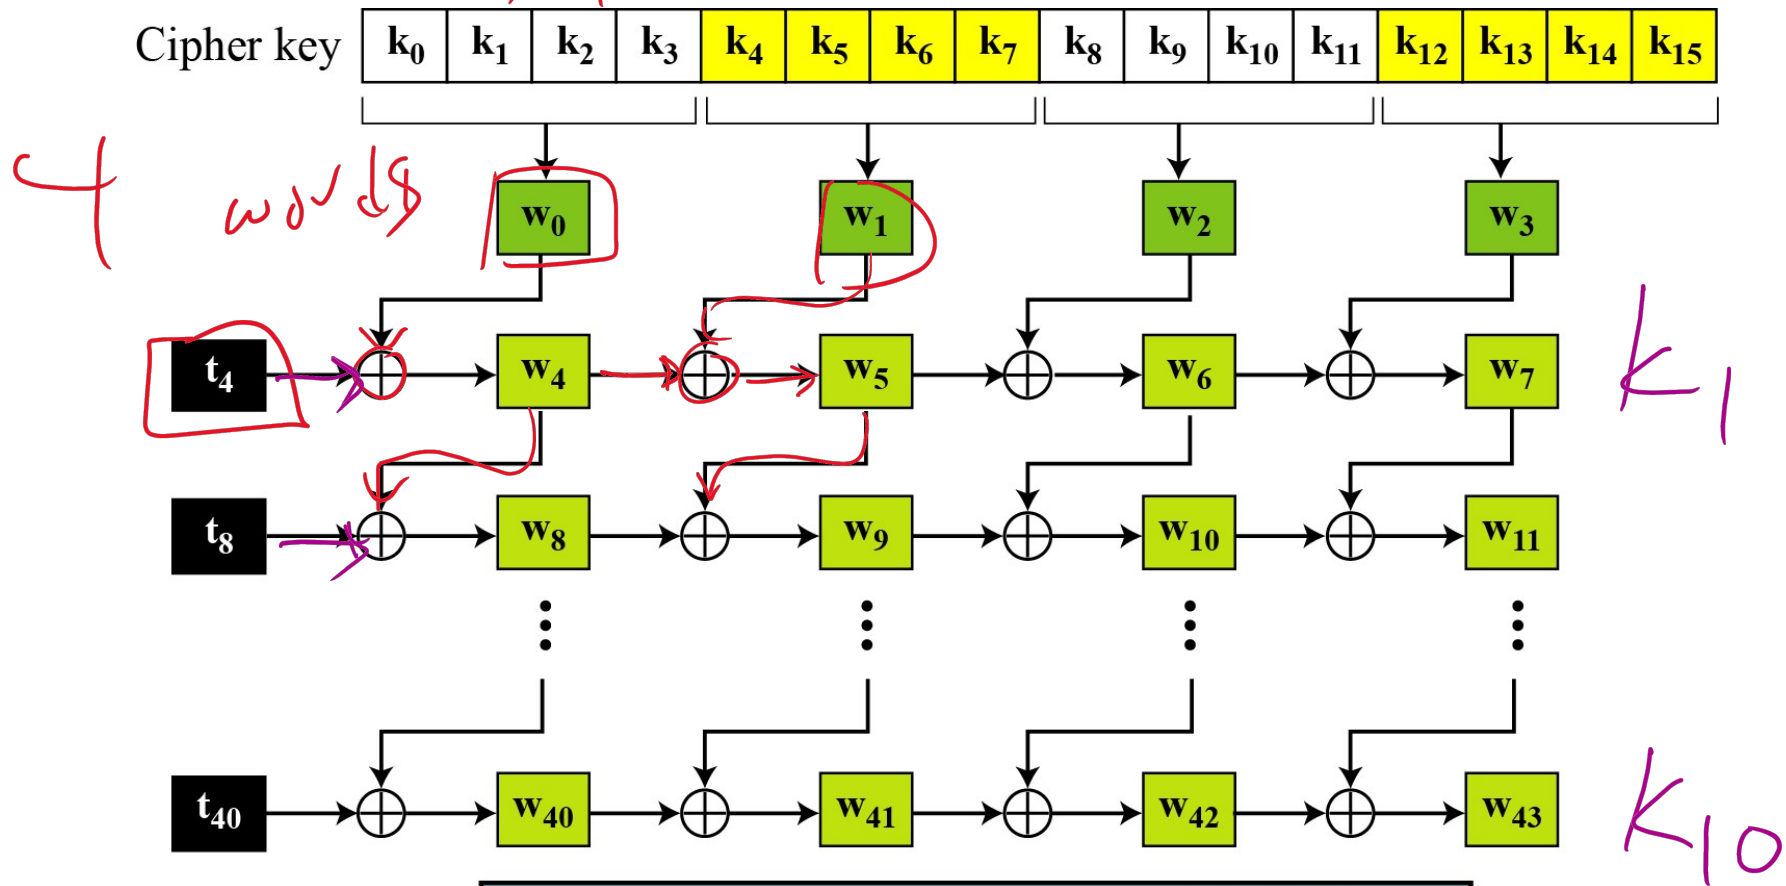

- ▶ takes 128-bits (16-bytes) key and expands into array of 44 32-bit words

Round		Words			
Pre-round	K_0	w_0	w_1	w_2	w_3
1	K_1	w_4	w_5	w_6	w_7
2	K_2	w_8	w_9	w_{10}	w_{11}
...	:	...			
$N_r = 10$	K_{10}	w_{4N_r}	w_{4N_r+1}	w_{4N_r+2}	w_{4N_r+3}

Key Expansion Scheme

16 Bytes

Making of t_i (temporary) words $i = 4 N_r$

Key Expansion submodule

- ▶ **RotWord** performs a one byte circular left shift on a word
For example:

$$\text{RotWord}[b_0, b_1, b_2, b_3] = [b_1, b_2, b_3, b_0]$$

- ▶ **SubWord** performs a byte substitution on each byte of input word using the S-box
 - ▶ **SubWord(RotWord(temp))** is XORed with RCon[j] – the round constant
-

Round Constant (RCon)

▶ RCON is a word in which the three rightmost bytes are zero

▶ It is different for each round and defined as:

$$\text{RCon}[j]_{\text{word}} = (\text{RCon}[j]_{\text{byte}}, 0, 0, 0)$$

$$\text{where } \text{RCon}[1]_{\text{byte}} = 1, \text{RCon}[j]_{\text{byte}} = 2 * \text{RCon}[j-1]_{\text{byte}}$$

▶ Multiplication is defined over $\text{GF}(2^8)$ but can be implemented in a Table Lookup

Round	Constant (RCon)	Round	Constant (RCon)
1	(<u>01</u> 00 00 00) ₁₆	6	(<u>20</u> 00 00 00) ₁₆
2	(<u>02</u> 00 00 00) ₁₆	7	(<u>40</u> 00 00 00) ₁₆
3	(<u>04</u> 00 00 00) ₁₆	8	(<u>80</u> 00 00 00) ₁₆
4	(<u>08</u> 00 00 00) ₁₆	9	(<u>1B</u> 00 00 00) ₁₆
5	(<u>10</u> 00 00 00) ₁₆	10	(<u>36</u> 00 00 00) ₁₆

Topics

- ▶ Origin of AES
- ▶ Basic AES
- ▶ Inside Algorithm
- ▶ **Final Notes**

AES Security

56-bit key
64-bit block size

- ▶ AES was designed after ~~DES~~.
- ▶ Most of the known attacks on DES were already tested on AES.
- ▶ Brute-Force Attack
 - ▶ AES is definitely more secure than DES due to the larger-size key.
- ▶ Statistical Attacks
 - ▶ Numerous tests have failed in attempts to perform statistical analysis of the ciphertext

▶ Differential and Linear Attacks

- ▶ There are no differential and linear attacks on AES as yet. "Test of Time"

mathematical
Noⁿ proof that AES
cannot be broken

Implementation Aspects

- ▶ The algorithms used in AES are so simple that they can be easily implemented using cheap processors and a minimum amount of memory.

▶ Very efficient

- ▶ Implementation was a key factor in its selection as the AES cipher

- ▶ AES animation:

- ▶ <https://www.youtube.com/watch?v=evjFwDRTmV0>
